Nonlinear Schrödinger equation on metric graphs

Cubic nonlinear Schrödinger (NLS) equation on a graph Γ :

$$i\Psi_t = -\Delta\Psi - 2|\Psi|^2\Psi, \quad x \in \Gamma, \tag{1}$$

where Δ is the graph Laplacian and $\Psi(t, x)$ is defined componentwise on edges subject to boundary conditions at vertices.

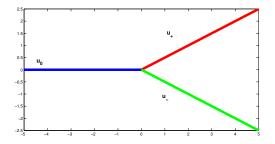

A metric graph $\Gamma = \{E, V\}$ is given by the sets of edges and vertices, with a metric structure on each edge. Proper boundary conditions are needed on the vertices to ensure that Δ is self-adjoint in $L^2(\Gamma)$.

Graph models are widely used in the modeling of quantum dynamics of thin graph-like structures (quantum wires, nanotechnology, large molecules, periodic arrays in solids, photonic crystals...).

Example: a star graph

A star graph is the union of *N* half-lines (edges) connected at a vertex. For N = 2, the graph is the line \mathbb{R} . For N = 3, the graph is a *Y*-junction.

Natural (Kirchhoff) boundary conditions:

- Components are continuous across the vertex.
- ► The sum of fluxes (signed derivatives of functions) is zero at the vertex.

▲□▶▲□▶▲□▶▲□▶ □ のQで

Laplacian on the star graph

The Laplacian operator on the star graph Γ is defined by

$$\Delta \Psi = (\psi_1'', \psi_2'', \cdots, \psi_N'')$$

acting on functions in $L^2(\Gamma) = \bigoplus_{j=1}^N L^2(\mathbb{R}^+)$.

Weak formulation of Δ on Γ is in

$$H^1_\Gamma := \{ \Psi \in H^1(\Gamma) : \quad \psi_1(0) = \psi_2(0) = \cdots = \psi_N(0) \},$$

Strong formulation of Δ on Γ is in

$$H_{\Gamma}^{2} := \left\{ \Psi \in H^{2}(\Gamma) : \quad \psi_{1}(0) = \psi_{2}(0) = \cdots = \psi_{N}(0), \quad \sum_{j=1}^{N} \psi_{j}'(0) = 0 \right\}.$$

Lemma

The graph Laplacian $\Delta: H^2_{\Gamma} \subset L^2(\Gamma) \to L^2(\Gamma)$ is self-adjoint.

NLS on the metric graph Γ

Nonlinear Schrödinger (NLS) equation can be defined on the metric graph Γ :

$$i\partial_t \Psi + \Delta \Psi + 2|\Psi|^2 \Psi = 0, \quad x \in \Gamma, \quad t \in \mathbb{R},$$

where both the linear term $\Delta \Psi$ and the nonlinear term $|\Psi|^2 \Psi$ are defined in the componentwise sense coupled at vertices V of Γ .

The mass functional

$$Q(\Psi) = \|\Psi\|_{L^2(\Gamma)}^2$$

is constant in time *t* (related to the phase rotation).

The energy functional

$$E(\Psi) = \|\partial_x \Psi\|_{L^2(\Gamma)}^2 - \|\Psi\|_{L^4(\Gamma)}^4$$

is constant in time *t* (related to the time translation).

Ground state

Ground state is a standing wave of smallest energy E at fixed mass Q,

$$\mathcal{E}_{\mu} = \inf\{E(\Psi): \Psi \in H^1_{\Gamma}, Q(\Psi) = \mu\}.$$

Euler-Lagrange equation for the constrained variational problem is

$$-\Delta \Phi - 2|\Phi|^2 \Phi = \Lambda \Phi \qquad \Phi \in H^2_{\Gamma}$$

where $\Lambda \in \mathbb{R}$ defines $\Psi(t, x) = \Phi(x)e^{-i\Lambda t}$.

Infimum \mathcal{E}_{μ} exists due to Gagliardo–Nirenberg inequality in 1D:

$$\|\Psi\|_{L^{4}(\Gamma)}^{4} \leq C_{\Gamma} \|\partial_{x}\Psi\|_{L^{2}(\Gamma)} \|\Psi\|_{L^{2}(\Gamma)}^{3},$$

for some Γ -specific C_{Γ} .

Ground state

Ground state is a standing wave of smallest energy E at fixed mass Q,

$$\mathcal{E}_{\mu} = \inf\{E(\Psi): \Psi \in H^1_{\Gamma}, Q(\Psi) = \mu\}.$$

Euler-Lagrange equation for the constrained variational problem is

$$-\Delta \Phi - 2|\Phi|^2 \Phi = \Lambda \Phi \qquad \Phi \in H^2_{\Gamma}$$

where $\Lambda \in \mathbb{R}$ defines $\Psi(t, x) = \Phi(x)e^{-i\Lambda t}$.

Infimum \mathcal{E}_{μ} exists due to Gagliardo–Nirenberg inequality in 1D:

$$\|\Psi\|_{L^{4}(\Gamma)}^{4} \leq C_{\Gamma} \|\partial_{x}\Psi\|_{L^{2}(\Gamma)} \|\Psi\|_{L^{2}(\Gamma)}^{3},$$

for some Γ -specific C_{Γ} .

Bounded graphs: \mathcal{E}_{μ} is achieved at one of the standing waves. Unbounded graphs: \mathcal{E}_{μ} may not be achieved at one of the standing waves.

Existence theorem for ground state

Adami–Serra–Tilli (2015, 2016): If Γ is unbounded and contains at least one half-line, then

$$\min_{u \in H^1(\mathbb{R}^+)} E(u; \mathbb{R}^+) \le \mathcal{E}_{\mu} \le \min_{u \in H^1(\mathbb{R})} E(u; \mathbb{R})$$

If Γ consists of either one half-line or two half-lines connected at a vertex with a bounded edge (pendant), then

$$\mathcal{E}_{\mu} < \min_{u \in H^1(\mathbb{R})} E(u; \mathbb{R})$$

and the infimum is achieved (ground state exists).

▲□▶▲□▶▲□▶▲□▶ ▲□▶ ● □ ● ● ●

Nonexistence theorem for ground state

Adami–Serra–Tilli (2016): If Γ consists of more than two half-lines and is *connective to infinity*, then

$$\mathcal{E}_{\mu} = \min_{u \in H^1(\mathbb{R})} E(u; \mathbb{R})$$

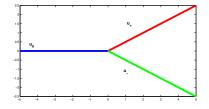

and the infimum is not achieved (ground state does not exist).

The reason is topological. By the symmetry rearrangements,

$$E(\Psi;\Gamma) > E(\hat{\Psi};\mathbb{R}) \ge \min_{u \in H^1(\mathbb{R})} E(u;\mathbb{R}) = \mathcal{E}_{\mu}.$$

At the same time, a sequence of solitary waves escaping to infinity along one edge yields a function sequence that minimizes $E(\Psi; \Gamma)$ until it reaches \mathcal{E}_{μ} .

Standing waves on the star graph

No ground state exists.

There exists the half-soliton state to the Euler–Lagrange equation:

$$-\Delta \Phi - 2|\Phi|^2 \Phi = \Lambda \Phi \qquad \phi \in H^2_{\Gamma},$$

▲□▶▲□▶▲□▶▲□▶ □ のQで

in the form $\Phi = (\phi, \phi, \dots, \phi)^T$ with $\phi(x) = \sqrt{|\Lambda|} \operatorname{sech}(\sqrt{|\Lambda|}x), x > 0$.

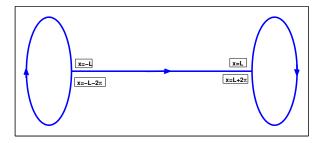

Half-soliton is a saddle point of energy *E* at fixed mass *Q*. (Adami *et al.*, 2012) (Kairzhan–P, 2018)

Main goals of our project:

- Understand standing waves of NLS on a general metric graph Γ in the limit of large mass Q in connection to existence or non-existence of a ground state of energy.
- Develop new analytical tools to approximate standing waves of NLS in the limit of large mass Q.

Dumbbell Graph

The PDE problem can be formulated in terms of components:

$$\Psi = \begin{bmatrix} \psi_{-}(x), & x \in I_{-} := [-L - 2\pi, -L], \\ \psi_{0}(x), & x \in I_{0} := [-L, L], \\ \psi_{+}(x), & x \in I_{+} := [L, L + 2\pi], \end{bmatrix},$$

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ─ □ ─ のへぐ

where L is half-length of the central edge and π is half-length of the loop.

Spectrum of the Laplacian on Γ

The linear problem is

$$-\Delta u = \lambda u \qquad u \in H^2_{\Gamma}.$$

Since Γ is compact, the spectrum of $-\Delta$ consist of isolated eigenvalues λ . Eigenfunction can be constructed explicitly with parametrization $\lambda = \omega^2$:

$$\begin{cases} u_0(x) = c_0 \cos(\omega x) + d_0 \sin(\omega x), & x \in I_0, \\ u_{\pm}(x) = c_{\pm} \cos(\omega x) + d_{\pm} \sin(\omega x), & x \in I_{\pm}. \end{cases}$$

which branch gives minimum of energy $E(\Psi)$ for fixed mass $Q(\Psi) = \mu$?

Theorem (Berkolaiko–Marzuola–P, 2018) If $Q_1(\Lambda) < Q_2(\Lambda)$ for every $\Lambda \in (-\infty, \Lambda_0)$, then $Q_1(\Lambda_1) = Q_2(\Lambda_2) = \mu \Rightarrow E_1(\Lambda_1) > E_2(\Lambda_2)$,

for every $\mu \in (\mu_0, \infty)$ with sufficiently large positive μ_0 .

Asymmetric state is the ground state on the dumbbell graph. (Adami–Serra, 2018)

Analytical technique in the limit of large mass

After rescaling

$$\Phi(x) = |\Lambda|^{1/2} \Psi(z), \quad z = |\Lambda|^{1/2} x,$$

the existence problem becomes

$$-\Delta_z \Psi + \Psi - 2|\Psi|^2 \Psi = 0, \qquad z \in J_- \cup J_0 \cup J_+,$$

where

$$\begin{split} J_{-} &:= & \left[-(L+2\pi)|\Lambda|^{1/2}, -L|\Lambda|^{1/2} \right], \\ J_{0} &:= & \left[-L|\Lambda|^{1/2}, L|\Lambda|^{1/2} \right], \\ J_{+} &:= & \left[L|\Lambda|^{1/2}, (L+2\pi)|\Lambda|^{1/2} \right]. \end{split}$$

Question: How to justify the approximation $\psi_{\infty}(z) = \operatorname{sech}(z)$. as $|\Lambda| \to \infty$?

▲□▶ ▲圖▶ ▲ 国▶ ▲ 国▶ - 国 - のへで

One stationary state with "surgery" technique

Break the dumbbell graph into two parts:

Central edge

$$-\psi_0''(z) + \psi_0 - \psi_0^3 = 0, \quad z \in J_0 = \left[-L|\Lambda|^{1/2}, L|\Lambda|^{1/2}\right].$$

Two loops

$$-\psi_{\pm}''(z) + \psi_{\pm} - \psi_{\pm}^3 = 0, \quad z \in J_{\pm}.$$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

with symmetry condition $\psi_{-}(-z) = \psi_{+}(z)$.

One stationary state with "surgery" technique

Break the dumbbell graph into two parts:

Central edge

$$-\psi_0''(z) + \psi_0 - \psi_0^3 = 0, \quad z \in J_0 = \left[-L|\Lambda|^{1/2}, L|\Lambda|^{1/2}\right].$$

Two loops

$$-\psi_{\pm}''(z) + \psi_{\pm} - \psi_{\pm}^3 = 0, \quad z \in J_{\pm}$$

with symmetry condition $\psi_{-}(-z) = \psi_{+}(z)$. Two exact solutions exist for the central edge:

$$\psi_0(z) = \frac{k}{\sqrt{2k^2 - 1}} \operatorname{cn}\left(\frac{z}{\sqrt{2k^2 - 1}}; k\right),$$

and

$$\psi_0(z) = \frac{1}{\sqrt{2-k^2}} \mathrm{dn}\left(\frac{z}{\sqrt{2-k^2}};k\right),$$

where $k \in (0, 1)$ is elliptic modulus. As $k \to 1$, $\psi_0(z) \to \psi_\infty(z) = \operatorname{sech}(z)$.

Define

$$p(k,\Lambda) := \psi_0(L|\Lambda|^{1/2})$$
 and $q(k,\Lambda) := |\psi'_0(L|\Lambda|^{1/2})|$

and consider solution in the right loop (use symmetry for the left loop):

$$-\psi_{+}''(z) + \psi_{+} - \psi_{+}^{3} = 0, \quad z \in \left[L|\Lambda|^{1/2}, (L+2\pi)|\Lambda|^{1/2}\right],$$

subject to the Dirichlet conditions:

$$\psi_+(L|\Lambda|^{1/2}) = \psi_+((L+2\pi)|\Lambda|^{1/2}) = p(k,\Lambda)$$

with $p(k, \Lambda)$ assumed to be small as $\Lambda \to -\infty$.

Define

$$p(k,\Lambda) := \psi_0(L|\Lambda|^{1/2})$$
 and $q(k,\Lambda) := |\psi'_0(L|\Lambda|^{1/2})|$

and consider solution in the right loop (use symmetry for the left loop):

$$-\psi_{+}''(z) + \psi_{+} - \psi_{+}^{3} = 0, \quad z \in \left[L|\Lambda|^{1/2}, (L+2\pi)|\Lambda|^{1/2}\right],$$

subject to the Dirichlet conditions:

$$\psi_+(L|\Lambda|^{1/2}) = \psi_+((L+2\pi)|\Lambda|^{1/2}) = p(k,\Lambda)$$

with $p(k, \Lambda)$ assumed to be small as $\Lambda \to -\infty$.

Lemma

There exists a unique solution of the boundary value problem satisfying

$$\|\psi_+\|_{H^2(J_+)} \le C |p(k,\Lambda)|.$$

Moreover, the Dirichlet-to-Neumann map satisfies

$$\psi'_+(L|\Lambda|^{1/2}) = -p(k,\Lambda) + \text{smaller terms.}$$

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

The remaining Kirchhoff condition

$$\psi'_+((L+2\pi)|\Lambda|^{1/2}) - \psi'_+(L|\Lambda|^{1/2}) = q(k,\Lambda)$$

leads to the root finding problem for k

 $q(k, \Lambda) = 2p(k, \Lambda) +$ smaller terms.

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ · □ · ○ ○ ○

The remaining Kirchhoff condition

$$\psi'_+((L+2\pi)|\Lambda|^{1/2}) - \psi'_+(L|\Lambda|^{1/2}) = q(k,\Lambda)$$

leads to the root finding problem for k

 $q(k, \Lambda) = 2p(k, \Lambda) +$ smaller terms.

Lemma

There exists a unique solution as $|\Lambda| \to \infty$ *:*

$$k = 1 - \frac{8}{3}e^{-2L|\Lambda|^{1/2}} + \text{smaller terms},$$

in the case if ψ_0 is the cn-function:

$$\psi_0(z) = \frac{k}{\sqrt{2k^2 - 1}} \operatorname{cn}\left(\frac{z}{\sqrt{2k^2 - 1}}; k\right).$$

The branch $\Lambda \mapsto Q$ for the mass of Ψ can be computed:

$$Q(\Lambda) = 2|\Lambda|^{1/2} - \frac{16}{3}L|\Lambda|e^{-2L|\Lambda|^{1/2}} + \mathcal{O}(e^{-2L|\Lambda|^{1/2}}) < 2|\Lambda|^{1/2}.$$

The other stationary state with "surgery" technique

Break the dumbbell graph into two parts:

► The right loop

$$-\psi_{+}^{\prime\prime}(z) + \psi_{+} - \psi_{+}^{3} = 0, \quad z \in \left[L|\Lambda|^{1/2}, (L+2\pi)|\Lambda|^{1/2}\right]$$

• The rest of the dumbbell graph

$$\begin{aligned} -\psi_0''(z) + \psi_0 - \psi_0^3 &= 0, \quad z \in J_0, \\ -\psi_-''(z) + \psi_- - \psi_-^3 &= 0, \quad z \in J_-. \end{aligned}$$

▲□▶▲□▶▲□▶▲□▶ ▲□ ● のへで

The other stationary state with "surgery" technique

Break the dumbbell graph into two parts:

The right loop

$$-\psi_{+}^{\prime\prime}(z) + \psi_{+} - \psi_{+}^{3} = 0, \quad z \in \left[L|\Lambda|^{1/2}, (L+2\pi)|\Lambda|^{1/2}\right]$$

The rest of the dumbbell graph

$$-\psi_0''(z) + \psi_0 - \psi_0^3 = 0, \quad z \in J_0, -\psi_-''(z) + \psi_- - \psi_-^3 = 0, \quad z \in J_-.$$

Again, two exact solutions exist for the right loop

$$\psi_{+}(z) = \frac{k}{\sqrt{2k^2 - 1}} \operatorname{cn}\left(\frac{z - (L + \pi)|\Lambda|^{1/2}}{\sqrt{2k^2 - 1}}; k\right),$$

and

$$\psi_{+}(z) = \frac{1}{\sqrt{2-k^{2}}} dn \left(\frac{z - (L+\pi)|\Lambda|^{1/2}}{\sqrt{2-k^{2}}}; k \right).$$

Solve the system for the rest of the graph under the Dirichlet condition at $z = L|\Lambda|^{1/2}$ and use Dirichlet-to-Neumann map to satisfies the Kirchhoff boundary condition at $z = L|\Lambda|^{1/2}$:

 $2q(k, \Lambda) = p(k, \Lambda) +$ smaller terms.

Lemma

There exists a unique solution as $|\Lambda| \to \infty$ *:*

$$k = 1 - \frac{8}{3}e^{-2\pi|\Lambda|^{1/2}} +$$
smaller terms.

in the case if ψ_+ is the dn-function. The branch $\Lambda \mapsto Q$ for the mass of Ψ can be computed:

$$Q(\Lambda) = 2|\Lambda|^{1/2} + \frac{16}{3}|\Lambda|\pi e^{-2\pi|\Lambda|^{1/2}} + \mathcal{O}(e^{-2\pi|\Lambda|^{1/2}}) > 2|\Lambda|^{1/2}.$$

By the main result, this stationary state localized in the loop is the ground state of NLS on the dumbbell graph in the limit of large mass.

Ground state for bounded graphs

Main question: Let $\Gamma = \{E, V\}$ be bounded. What is the ground state as $Q \to \infty$ (or $\Lambda \to -\infty$)?

1. If *E* includes terminal edges (pendants), the ground state is the half-soliton in the longest pendant.

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Ground state for bounded graphs

Main question: Let $\Gamma = \{E, V\}$ be bounded. What is the ground state as $Q \to \infty$ (or $\Lambda \to -\infty$)?

- 1. If *E* includes terminal edges (pendants), the ground state is the half-soliton in the longest pendant.
- 2. If E does not have pendants but includes loops connected to a single edge, the ground state is the soliton in the shortest loop.
